Fixing SSH Connection Refused Error ¹ ² ³

The "SSH connection refused" error occurs when attempting to establish a secure shell connection to a remote server, indicating a breakdown in communication. Here are some common causes and solutions to resolve this issue.

Example

```
ssh user@remote_host
ssh: connect to host remote_host port 22: Connection refused
```

1. SSH Client Not Installed

Ensure the SSH client is installed on your local machine. For Ubuntu/Debian systems:

```
sudo apt install openssh-client
```

For CentOS/RHEL systems:

```
sudo yum install openssh-client
```

1

2. SSH Daemon Not Installed on Server

Verify if the SSH daemon (sshd) is installed on the remote server:

```
ssh localhost
```

If the connection is refused, install the SSH daemon:

```
sudo apt install openssh-server
```

1

3. Wrong Credentials

Double-check your username, password, and IP address. Use the `ping` command to verify the server's reachability:

```
ping [server_ip_address]
```

2

4. SSH Service Is Down

Check the status of the SSH service:

```
sudo service ssh status
```

If it's down, start the service:

```
sudo systemctl start sshd
sudo systemctl enable sshd
```

3

5. Firewall Blocking SSH Connection

Ensure the firewall allows SSH connections:

```
sudo ufw allow ssh
```

3

6. SSH Port Is Closed

Check if port 22 is open:

```
sudo ss -tln -i:22
```

If closed, open it using iptables:

```
sudo iptables -A INPUT -p tcp --dport 22 -m conntrack --ctstate NEW,ESTABLISHED -j ACCEPT
```

2

By following these steps, you can troubleshoot and resolve the "SSH connection refused" error effectively.
