Changing Device Name in Linux 1 2 3

Changing the device name (hostname) in Linux is a straightforward process that can be done using the command line or the graphical user interface (GUI). The hostname is a label assigned to a machine that identifies it on a network. Here are the steps to change the hostname in Linux:

Using Command Line

Using hostnamectl Command

The `hostnamectl` command is used on modern Linux distributions that use systemd. This command allows you to set or display the current hostname of the system.

1. **Check the current hostname:** `$ hostnamectl` This command will display the current hostname and other system information 1 2.
2. **Change the hostname:** `$ sudo hostnamectl set-hostname new-hostname` Replace `new-hostname` with the desired hostname. This command does not produce output but returns 0 on success 1 3.
3. **Verify the change:** `$ hostnamectl` This will display the new hostname along with other system information 3.
4. **Update the /etc/hosts file:** Edit the `/etc/hosts` file to reflect the new hostname: `$ sudo nano /etc/hosts` Change the line that contains the old hostname to the new hostname:
`127.0.0.1 localhost 127.0.1.1 new-hostname`

Using hostname Command

The `hostname` command can also be used to change the hostname, but this change is temporary and will revert after a reboot.

1. **Change the hostname:** `$ sudo hostname new-hostname` Replace `new-hostname` with the desired hostname 2.
2. **Verify the change:** `$ hostname` This will display the new hostname 2.

Using /etc/hostname File

For a more permanent change, you can edit the `/etc/hostname` file directly.

1. **Edit the /etc/hostname file:** `$ sudo nano /etc/hostname` Replace the existing hostname with the new hostname and save the file 1 2.
2. **Update the /etc/hosts file:** Edit the `/etc/hosts` file to reflect the new hostname: `$ sudo nano /etc/hosts` Change the line that contains the old hostname to the new hostname:
`127.0.0.1 localhost 127.0.1.1 new-hostname`

Using GNOME GUI

If you are using the GNOME desktop environment, you can change the hostname through the GUI.

1. **Open the Settings menu** from GNOME's application launcher.
2. **Click on the About tab at the bottom.**
3. **Click on Device Name** and enter the new hostname.
4. **Click Rename** to finalize the changes 1.

By following these steps, you can easily change the hostname of your Linux system, ensuring that it is appropriately named for easy identification on the network 1 2 3.

Hostname

L'hostname è il nome identificativo di un dispositivo (host) all'interno di una rete di calcolatori. Può far parte di un URL. Su Internet l'hostname permette di associare una denominazione ad un indir...

W Wikipedia

L'hostname è il "nome" del nostro computer sulla rete, è quindi il nome con cui verrà di solito visualizzato quando altri computer nella stessa rete cercheranno risorse di rete.

A differenza dell'indirizzo IP, l'hostname di un PC è **facile da memorizzare** e **ricordare**. A questo scopo, si dovrebbe sempre conoscere l'hostname del proprio PC.

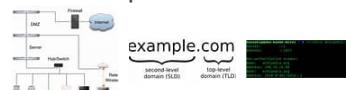

Il file hosts di Windows è un **file di testo** del sistema operativo utilizzato per mappare un nome host (hostname) in indirizzo IP.

How to change hostname on Linux - LinuxConfig

The following method will work on systems that use systemd (most of the popular Linux distros today). If your system uses init, we cover a separate method in the next section. 1. First, let's check the current hostname by using either the `hostname` or `hostnamectl` command.
